

Greetings

As a mechanical design consultant I can bring to your company or your project 35 years mechanical design, machine design, and mechanical drafting experience. Along with this experience, I also bring determination, dedication, and drive to satisfy your requirements, no matter what.

An employee normally works 8 hours a day, and any time over that incurs additional wages and costs. I, however, am able to work 10, 12, or often 14 hours a day, even 6 days a week; incurring for you only hourly rates without any overtime premiums. This means you pay straight time, all the time.

Using me as a design consultant allows you to avoid many costs associated with a direct employee; office space, lights and power, computer, software, insurance, holiday pay, sick pay, and miscellaneous other costs and equipment.

Also, when I'm off the tasks of the job I am off the clock, and you are relieved of any responsibilities or obligations to me, or requirements to pay me or find me other tasks or projects.

I have experience in aerospace, optics, medical, automotive, industrial, scientific, environmental, and ecological areas of endeavor.

I have experience and success in almost all areas and processes of fabrication; machining, welding, injection molding, casting, forming, additive manufacturing, tooling, fixtures, gages, and I am adaptable to any process or technique not mentioned here.

Many companies and managers are concerned that a worker off-site and out of sight may be billing time without doing actual work. My custom is to submit demonstration of progress at the end of the first day or possibly the second day.

My agreements are constructed so the client can terminate the agreement at any time, and if the progress after 2 days or 4 days is not satisfying their expectations there would be no requirement for the client to pay anything for those 'unproductive' hours, which, by the way, have never occurred.

It is often said, "talk is cheap", so it seems evident proof of my claims is required. I have made this 'proof' available for review within seconds at your convenience.

There are examples of successful non-classified and non-proprietary projects I have completed at www.dds-sd.com under samples, and under projects.

These are projects on which I have completed the mechanical design layouts, all the fabrication and assembly drawings and parts lists, and assisted in procuring all fabricated parts, and occasionally assembly and alignment of the assemblies and systems, as well as designing fixtures for assembly, alignment, and verification.
